Tp link extender stopped working

Just bought a TP-LINK Wireless WiFi range extender? Having connection problems with it? Well you're not alone. It appears that these WiFi repeaters are causing a lot of people a lot of headaches ... and it's not just TP-LINK if you take some time to Google the problem (and product reviews) you'll find that the majority of WiFi repeaters are difficult to set-up and connect. This page has been created to share our experience with the TP-LINK TL-WA850RE although the advice may very well work with other models. **DISCLAIMER:** this advice is given in good faith and you will use it at your own risk. We are not technical boffins (in fact we're still fascinated by fire and instant gravy) so if you blow up your computer in the process you've only got yourself to blame. So here's the thing. You may have found that the WPS function on the TP-LINK repeater doesn't work. This isn't uncommon. Our main wireless router has always connected faultlessly via WPS with other devices (including another make of wifi repeater) but it seems that the TP-LINK TL-WA850RE does not connect with WPS very happily. So when WPS fails you'll probably resort to 'Method Two' which they describe as 'Set-up by Web-Based Management Page'. This might cause you another problem! After making your wireless connection to your new repeater you are told to open your web browser and type tpinkextender.net to access a set-up facility which seems simple enough. Unfortunately , for many people tpinkextender.net does not work ... even worse typing tpinkextender.net into your address bar might take you to a page that looks like it's full of spam, adverts and other bad things. **GOOD NEWS EVERYONE!** ... we found a solution to this! Once you have made your wireless connection to the TP-LINK signal extender don't type tpinkextender.net in the address bar ... instead type `http://192.168.0.1` which hopefully will open up the admin panel so that you can finally connect your existing wireless router with your new TP-LINK repeater. (Thanks to Mitch who has contacted us to suggest we add a reminder to fill in ADMIN as the user name and password). Thanks also to Ron who sent us this supporting information: "I resorted to your advice after encountering problems with the TP-Link extender instructions. I followed your advice for setting the TP-Link extender (model TL-WA850RE), made a few trials and finally it worked! Specifically, this is what I did, after disconnecting the router from the computer and connecting the extender instead.1. Used the URL you suggested. . Selected the automatic custom name (EXT13. Unplugged the extender after the last step finished with, Completed!" © 1996-2014. Amazon.com, Inc. or its affiliates Are you fed up with the dead spots around your house and cannot get enough internet speed to complete your task? This can be frustrating when you are stuck with slow internet speed. But, not anymore! TP-Link brings the extender to expand your internet speed and provides the extended network area. You can easily set up your device within a few minutes. Here, you will learn about the setup procedure and how to resolve the issue of the TP-Link Extender not working. TP-Link Extender Setup Procedure If you need some simple steps to do the setup here is the easiest way to set up your device without any problem. See the information given below. To get started with the setup process, you have to join your router and extender and then your extender to your computer using the Ethernet cable.Then, log into the management page of your range extender and then click Network.Your extender's IP address should be the same as the IP segment, then click on the Save button.Go to quick setup and then to wireless. You have to choose the range extender and then search.Choose the SSID name from the list and enter the password and click save.Now, follow the instructions given on the screen to finish the configuration process. **Steps To Resolve The Issues Of TP-Link Extender Not Working** If you are facing TP-Link issues and want to know how to resolve the issues of TP-Link extenders not working, this is the place for you. Resolve this issue with the steps provided below. You can check if there is a proper connection between your devices. You can disconnect them and then connect them again properly.Check if you are entering the correct web address or IP address. That might create problems. Make sure you are entering the correct login details.Make sure your range extender is not too far away from the router.You need to make sure that your main router has not any enabled security settings.Check the signal strength of your end device. If only one device cannot connect, you can remove the device and then connect it again.You can check if your firmware needs to be updated. If there is an update available, you have to update your device's firmware and check if that works.Rebooting your device might fix the issue.If nothing above resolves this issue, you can reset your device to the factory default version. For that, you have to locate the reset button on your device and press it with a small paper pin. Then release the button after a few seconds. Your device will be set to the factory default version. **Conclusion** With the information provided above, you will be able to do the setup of your extender and know how to resolve the issue of the TP-Link Extender not working. Once you are all done with the setup and login process, you will be able to stream your favorite HD videos and then play online games without any problem. For more detailed information, you can give us a call on our toll-free number and get your issues resolved. **How To Resolve The Issue of TP-Link Extender Not Working?** If you want to expand your wireless network, reduce interference and make the WiFi signal stronger, the TP-Link WiFi extender is the right choice. However, there are situations when it can signal that there is something wrong and that it requires your immediate attention. In this case, we are going to cover the TP-Link WiFi extender red light, what might be the causes for it, and how to fix it.**So let's start!**The red light on your TP-Link WiFi extender usually indicates that the WiFi signal is too weak. To be more precise, if the signal strength is at 30% or less you will see the red light.And now let's see what you can do to get rid of it and see the green light again.**Unplug It And Plug It Back In**The first thing to try is pretty simple and very effective. All you need to do is to unplug the extender from the electrical outlet. Leave it disconnected for 10-20 seconds and then plug it back into the wall outlet. Now just give it some time to boot up completely and connect. You should see the green lights pretty soon.However, if the red light is still on after you do this, try the following.**Move It Closer**We have mentioned that the red light indicates that the WiFi signal is too weak. This might have happened if you have moved or replaced the router recently. Also, maybe a new device is causing interference and affecting the WiFi signal strength, so you will have to investigate this as well.However, in order to make the signal better, we need to move the extender closer. Plug the extender closer to the router and wait for it to reconnect. As a result, we can expect to have a stronger signal between the router and the extender, and of course, the red light should turn green now.**Corrupt or obsolete firmware** can also be the reason for this behavior. Although it is highly recommended to keep the firmware up-to-date we often forget to check this. In order to do this, you need to login into the extender's admin dashboard and then find the Firmware update section. This is usually located in the System Tools menu. There you can choose to perform a Local or Online firmware upgrade.Resetting the extender to factory defaults is another solution to the problem you might want to try. However, before you start you have to know that you will have to set it up again. This is necessary because the factory-reset process will revert the extender's settings to the state when it was brand new. All the settings you have changed will be erased.Some extenders come with a reset button while others have this button hidden inside of a pinhole.If your TP-Link WiFi Extender has a Reset button, make sure the extender is powered on. Press the Reset button and keep it pressed for a couple of seconds. The extender will reboot and this is when you should release the reset button.If the Reset button is hidden, you will need to use a pointed object like a paper clip or a pen to press the button. When you press it, hold it for around 10 seconds. The extender will reboot. Give it some time to boot up and stabilize.These two ways to reset the TP-Link WiFi extender to factory defaults should help you fix the TP-Link WiFi extender red light issue. To make sure you have reset it to factory defaults try to login to its admin panel with the default login details.All you have to do now is to connect and set up the TP-Link extender again.If you have tried everything and the red light is still on, it is recommended to contact Support. Make sure to thoroughly explain what the problem is. They can give some tips on how to fix the problem. In case your device is defective and it's still under warranty, you might expect to get a replacement.**Final Words**We hope that you have fixed the TP-Link extender red light successfully by now. When you know the reason for this problem, it isn't that difficult to fix it. You just need to start with the simplest and easiest solutions first and then move to the advanced ones gradually. Hopefully, you won't need to reset the extender to factory settings or get in touch with support. But if you have to, feel free to do it. After all, it is pretty important to have a strong and stable internet connection in every corner of our home.**Hey, I'm David.** I've been working as a wireless network engineer and a network administrator for 15 years. During my studies, I also worked as an ISP field technician - that's when I met Jeremy. I hold a bachelor's degree in network engineering and a master's degree in computer science and engineering. I'm also a Cisco-certified service provider. In my professional career, I worked for router/modem manufacturers and internet providers. I like to think that I'm good at explaining network-related issues in simple terms. That's exactly what I'm doing on this website - I'm making simple and easy-to-follow guides on how to install, set up, and troubleshoot your networking hardware. I also review new network equipment - modems, gateways, switches, routers, extenders, mesh systems, cables, etc. My goal is to help regular users with their everyday network issues, educate them, and make them less scared of their equipment. In my articles, you can find tips on what to look for when buying new networking hardware, and how to adjust your network settings to get the most out of your wi-fi. Since my work is closely related to computers, servers, and other network equipment, I like to spend most of my spare time outdoors. When I want to blow off some steam, I like to ride my bike. I also love hiking and swimming. When I need to calm down and clear my mind, my go-to activity is fishing.
